

BIRCH ALLERGENS QUANTIFICATION WITH CORIOLIS® AIR SAMPLER

ZAUM, Germany

/ CONTEXT

The information provided by pollen grains and spores counts cannot be ignored by allergists and allergic individuals but there is sometimes a divergence observed with clinical observations. It has led to measure directly **airborne allergens during pollen season** to determine a rate of allergenicity in the air.

In this study, the birch pollen, which is a major pollen across the Europe, was monitored during the birch pollen season 2008 (April) in Munich. Sampling birch pollen with **Coriolis® operated with a “dry cone”** (no collection liquid) and measuring the extracted allergen *Bet v 1* with ELISA assay were carried out.

/ MATERIALS

- Coriolis® air sampler.
- Coriolis® plastic cones.
- Burkard pollen trap (moving adhesive band).
- Monoclonal *Bet v 1* specific antibodies assay.

/ PROTOCOL

• *Bet v 1* quantification

6h daily sampling with Coriolis®; 200L/min; allergen extraction with NH_4HCO_3 pH8.1 + 0.1% BSA; centrifugation; sub-division of supernatant and storage at -80°C, immuno-assay.

• *Bet v 1* quantification

6h daily sampling with Coriolis®; 200L/min; allergen extraction with NH_4HCO_3 pH8.1 + 0.1% BSA; centrifugation; sub-division of supernatant and storage at -80°C, immuno-assay.

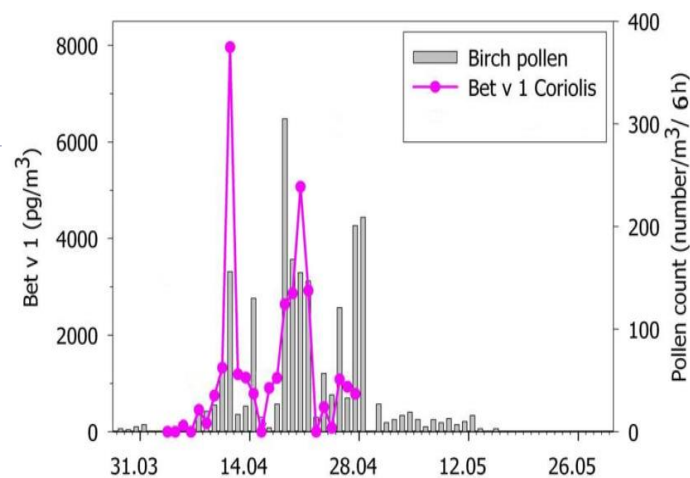

/ CONCLUSION

Birch pollen sampling with **Coriolis®** operated with a **dry cone** is an efficient sampling technique for determining *Bet v 1* in ambient air. This methodology is also applicable to other allergenic pollen grains.

Data on allergens is much more interesting than only pollen grain counts in order to deliver better information for clinicians and atopic people

/ RESULTS

Similar temporal evolution is observed between ***Bet v 1* allergens** concentration and **birch pollen** count: high levels of *Bet v 1* sampled with Coriolis® were found on all days with high pollen flight, low levels of allergen on all days with low pollen count.
